

SAP Active Archiving

Automate manual data archiving processes with Kyano Outboard ERP Archiving

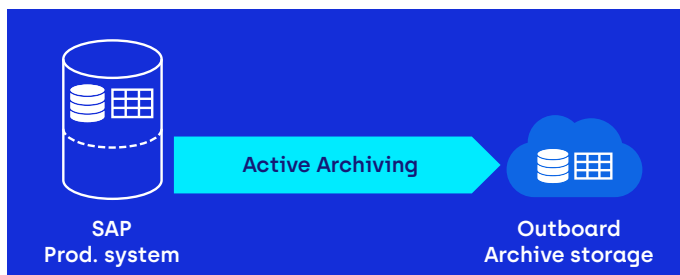

Shrink and limit your data footprint with efficient data archiving processes and stay compliant

Data is a key strategic resource for every company. High performing operative systems keeping only "hot" data in the (in memory) database ensures that processes run more smoothly and operations more efficiently, but even more importantly, it helps companies to keep their overall total cost of ownership (TCO) within the budget, especially when running on state-of-the-art technologies such as SAP HANA.

Analyze – Automate - Archive

With digitization, SAP databases grow quickly over time and often contain mature data that is accessed very seldomly or needs to be retained for legal purposes. The first step is to identify this data and determine its archiving potential to free up valuable (in memory) database space wherever possible. This reduces data hosting costs, shrinks the data footprint, improves compliant storage, and slows down data growth, creating long-term benefits for the company.

Kyano Outboard ERP Archiving can help you identify the archiving potential of your system through standard SAP data archiving processes, ensuring that end users can easily access the archived data in the same way as before.

Our solution enables shrinking your SAP database significantly, slow down future data growth, and improve archiving performance by setting up respective tasks automatically – eliminating tedious, manual work.

Mitigate risk and ensure compliance while supporting both your cloud and S/4HANA strategies

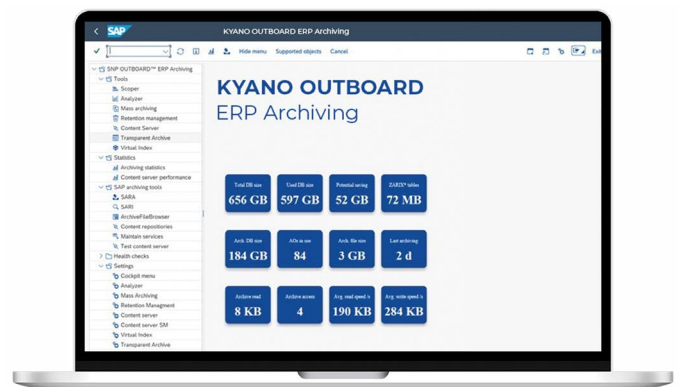

Kyano Outboard ERP Archiving can not only cut your SAP database size, but with our flexible archive interface, you can store the archived data compliantly in the most cost-effective storage solution of your choice – including all the major cloud providers such as Microsoft, Google and AWS. Even if your cloud strategy changes, you can easily adapt and always add or migrate to the latest technology, ensuring seamless, future-proof access to historical data.

However, data shouldn't be kept forever. Whenever it's expired, or even when it's legally required to destroy the data, Kyano Outboard ERP Archiving features for retention management and legal holds cover you for audits, GDPR, HIPAA, GBLA and much more.

Access and leverage 100% of your SAP data for intelligent insights

Kyano Outboard ERP Archiving makes historical data transparent and available for essential analytics and intelligent insights that can not only foster innovation but even disruption. Even though your data may be archived in the cloud, you can still easily access it via the SAP standard and enable intelligent insights with historical data – lowering overall SAP TCO and increasing innovation and business continuity.

With Kyano Outboard ERP Archiving, you can be sure you have the best solution for you in terms of costs, functionality, future architecture and a foundation to serve your intelligent enterprise.

Key benefits

- Automates manual data archiving tasks
- Slows down data growth and improves system performance
- Brings ROI in 6–18 months
- Stays in-line with current and future architecture
- Lean interface to state-of-the-art storage platforms – cloud and on-prem
- Provides lean retention management to destroy expired data and documents compliantly, including legal hold
- Makes archived data transparent and available for analytics
